

# HTAP Work Package 2.6: Comparison of Source Receptor (SR) and Source Attainment (SA) Methods

HTAP Meeting  
03/22/2031

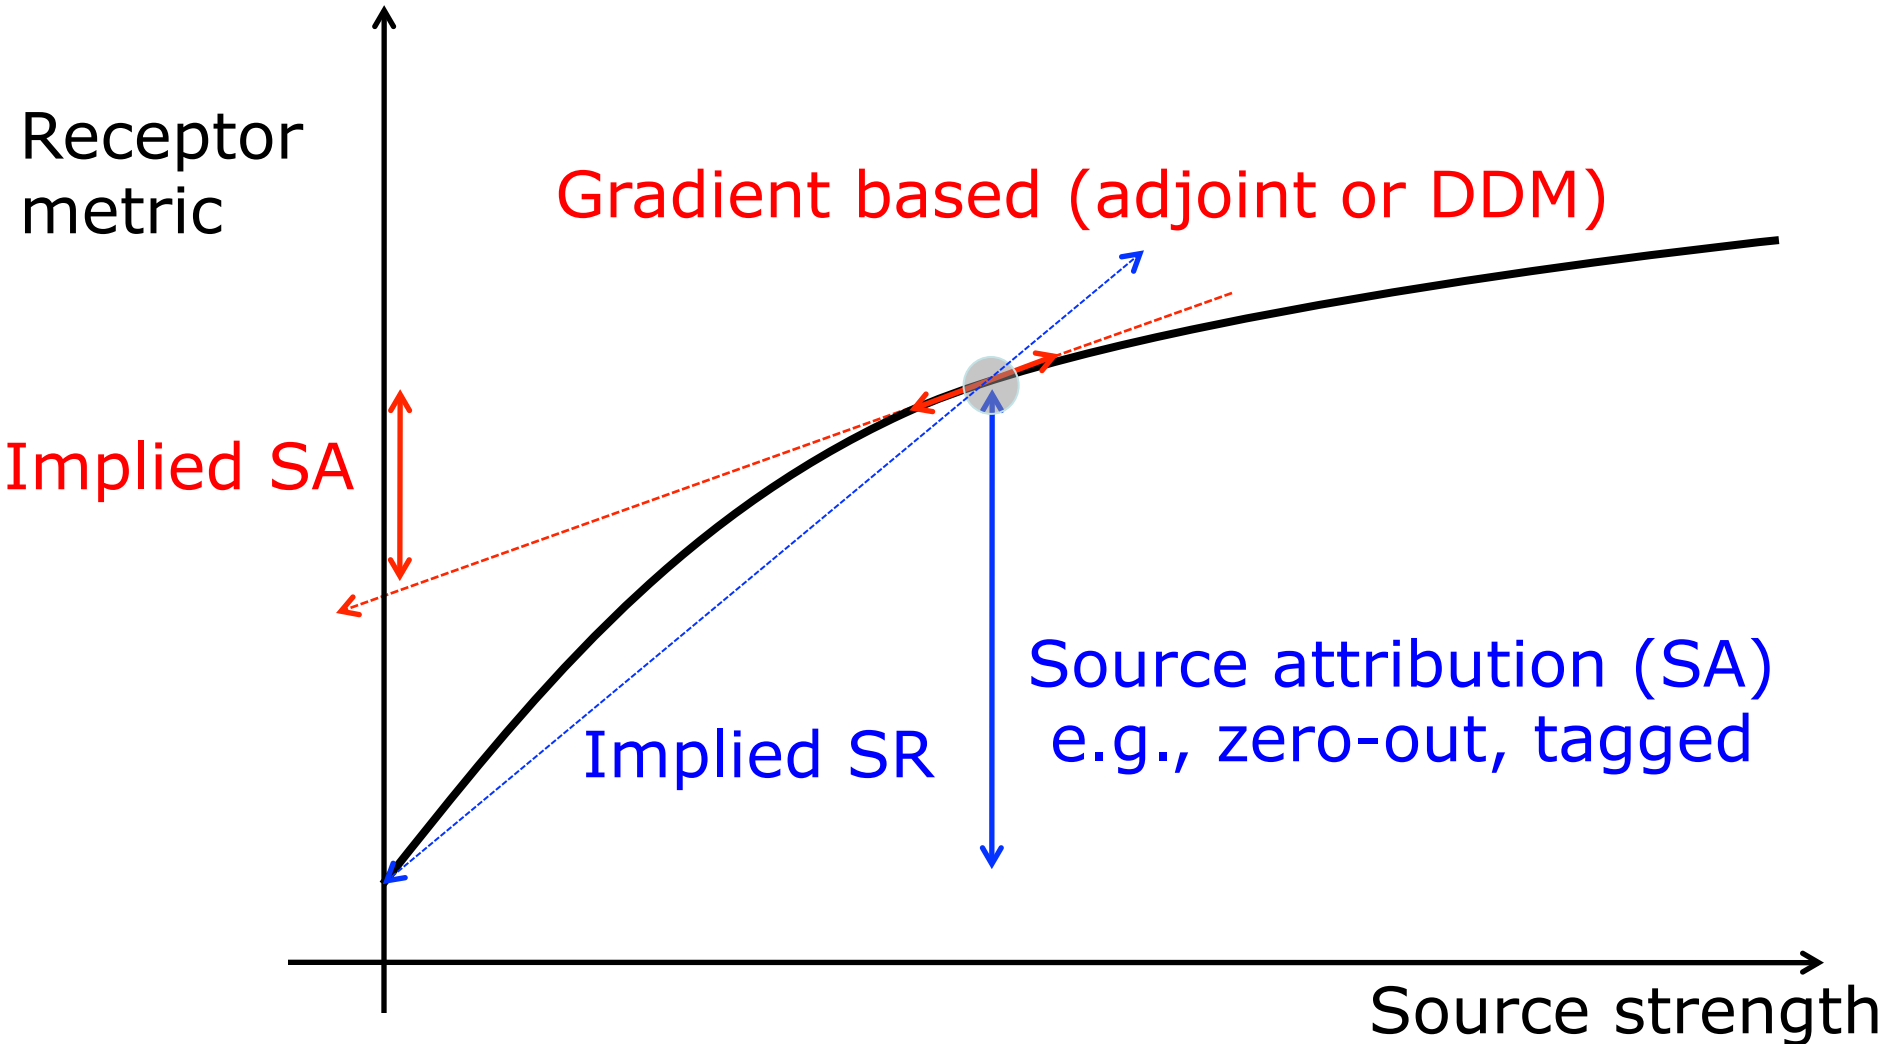

Daven K. Henze, Kateryna Lapina,  
Forrest Lacy, Jana Milford (CU Boulder)  
Min Huang, Kevin Bowman (JPL, NASA),  
Meiyun Lin (NOAA/Princeton U), Arlene Fiore (Columbia U),  
Greg Carmichael (U of Iowa), Gabi Pfister (NCAR)

NASA AQAST

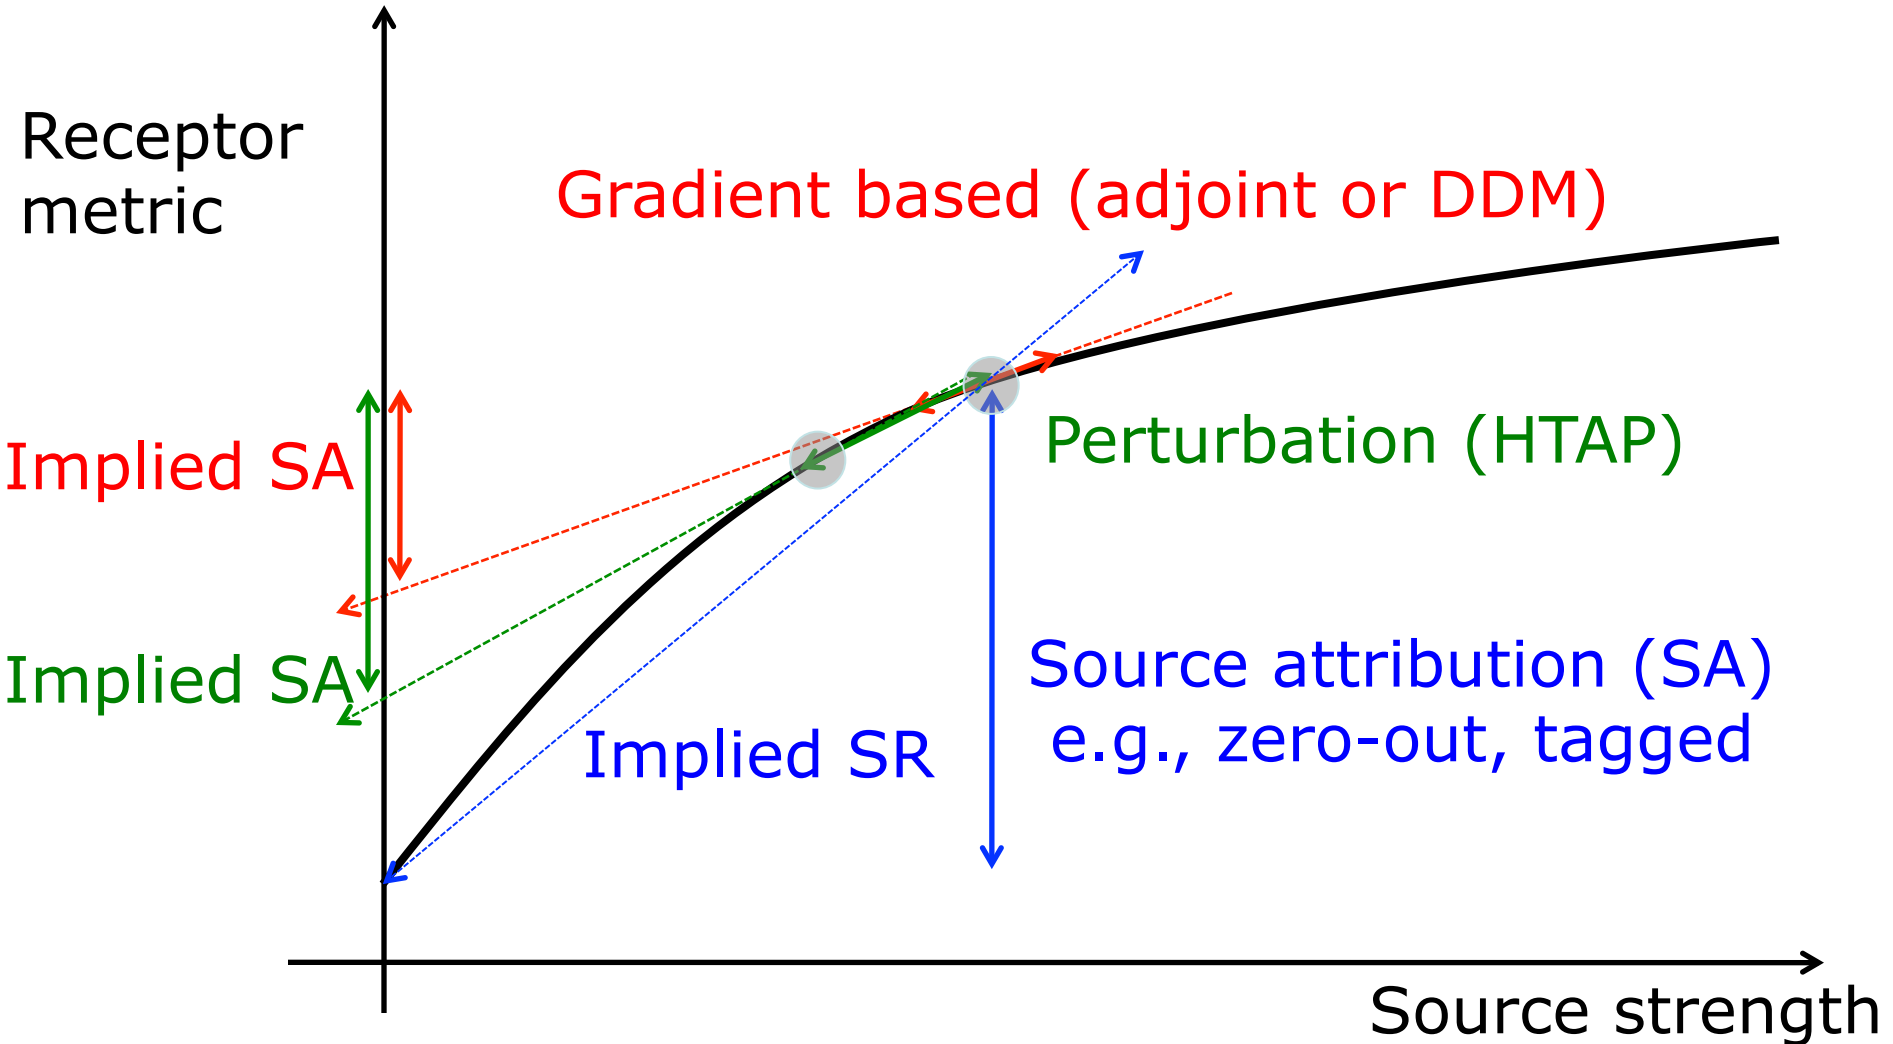

# Concerns for nonlinear systems

# Concerns for nonlinear systems

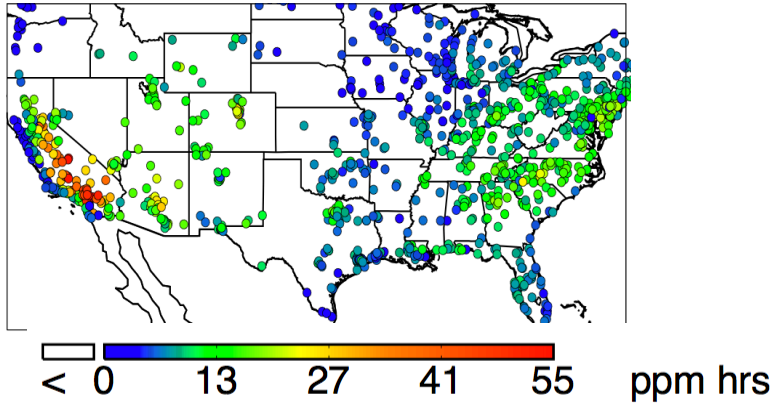

# Concerns for nonlinear systems

*HTAP: we have multiple models capable of each*

# Case study: US vegetative ozone exposure

W126 in 2008 (AQS & CASTNET)

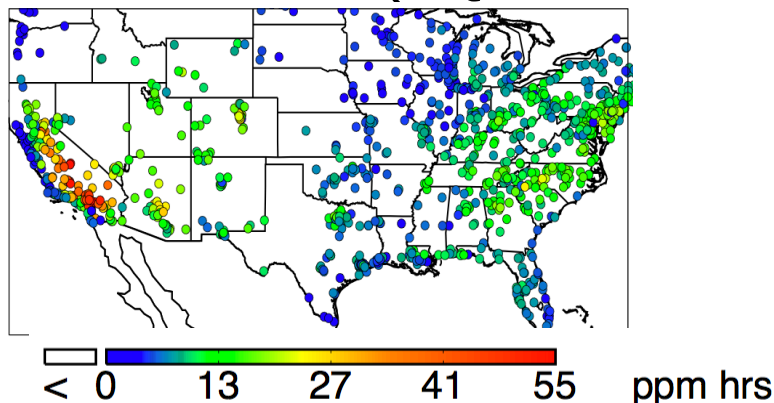

$$W126 = \sum_{i=1} w_i \times [C_{O_3}]_i$$

Many of the US counties are projected to violate secondary standard, even if they are not violating primary  $O_3$  standard

# Case study: US vegetative ozone exposure

W126 in 2008 (AQS & CASTNET)

$$W126 = \sum_{i=1} w_i \times [C_{O_3}]_i$$

Many of the US counties are projected to violate secondary standard, even if they are not violating primary O<sub>3</sub> standard

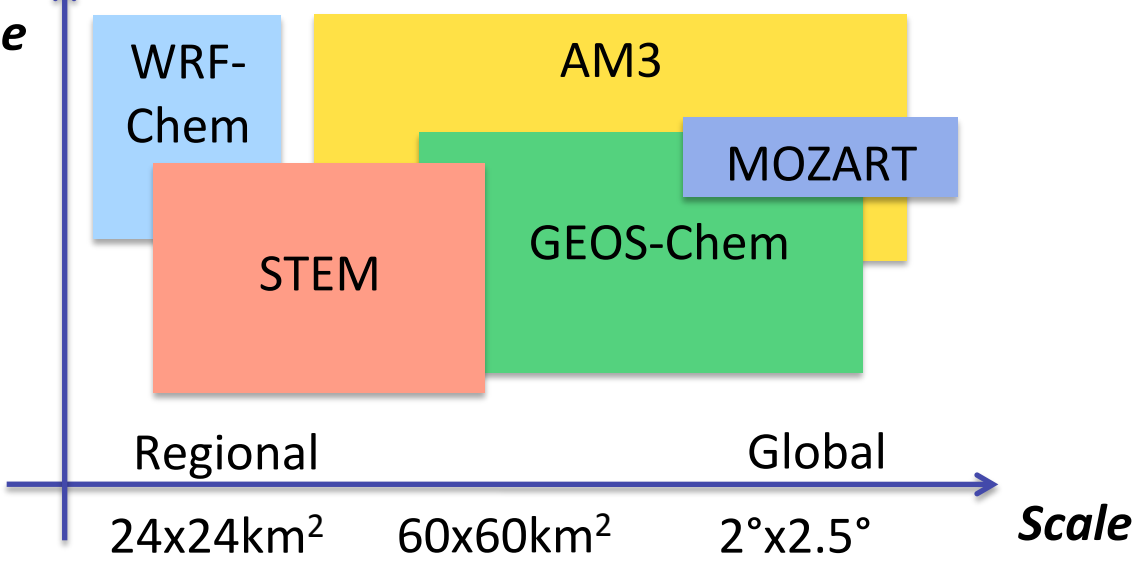

## Source Attribution Technique

Tagged tracers

Emission

perturbations

Adjoint sensitivities

# North American Background (NAB)

mid June – mid July 2008

Surface O<sub>3</sub>

W126

AM3

GEOS-Chem

WRF-Chem

STEM

W126 function

NAB estimated by zeroing out NA anthropogenic emissions in the models ("NAB" simulation)

< 20 32 45 57 70 ppb

< 0.00 0.83 1.65 2.48 3.30 ppm hrs

Normalization is needed given the variability across models

# Variability in one SA approach: NAB Contribution to W126

Model-only: NAB contribution based on the base and "NAB" model runs, %:

$$\frac{\sum_{i,j} W126\_NAB_{i,j}}{\sum_{i,j} W126\_total_{i,j}} \times 100\%$$

# Variability in one SA approach: NAB Contribution to W126

Model-only: NAB contribution based on the base and "NAB" model runs, %:

$$\frac{\sum_{i,j} W126\_NAB_{i,j}}{\sum_{i,j} W126\_total_{i,j}} \times 100\%$$

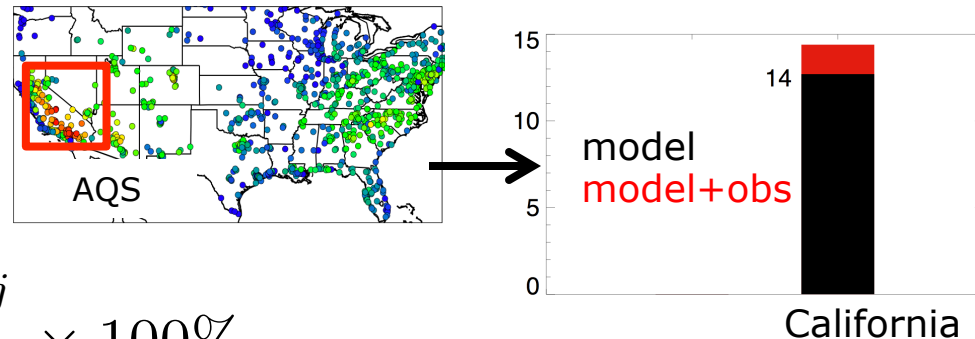

## Model & Observations:

contribution relative to the observed W126, model is used in a relative sense:

$$\frac{\sum_{i,j} \frac{W126\_NAB_{i,j}}{W126\_total_{i,j}} \times W126\_obs_{i,j}}{\sum_{i,j} W126\_obs_{i,j}} \times 100\%$$

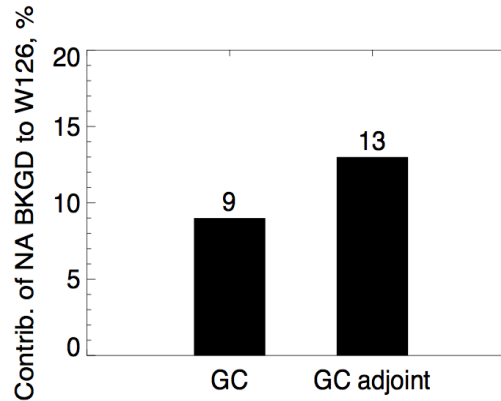

NAB contribution to selected regions, %

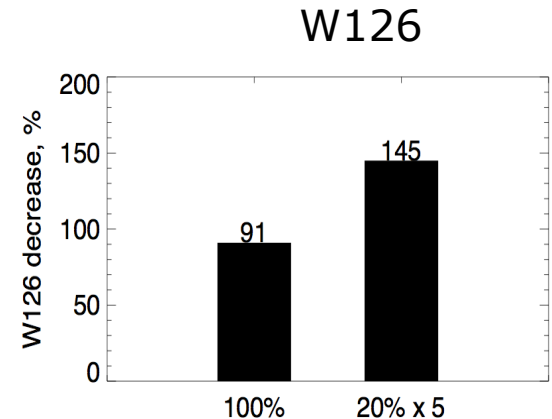

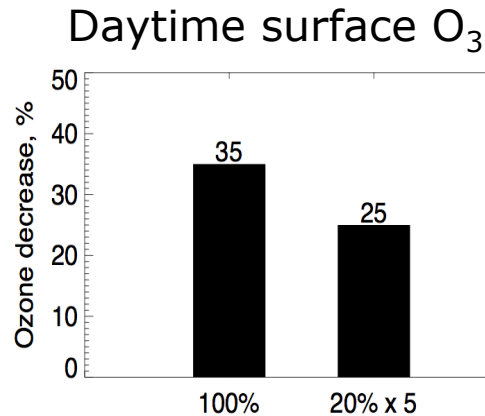

- RERER metric when source ≠ receptor?
- Use observations to adjust SA/SR relationships to account for bias?

# Variability across SA approaches

W126 NAB:  
100%  $\Delta\text{NO}_x$  vs adjoint

(20%  $\Delta\text{NO}_x$ ) x 5  
VS  
100%  $\Delta\text{NO}_x$

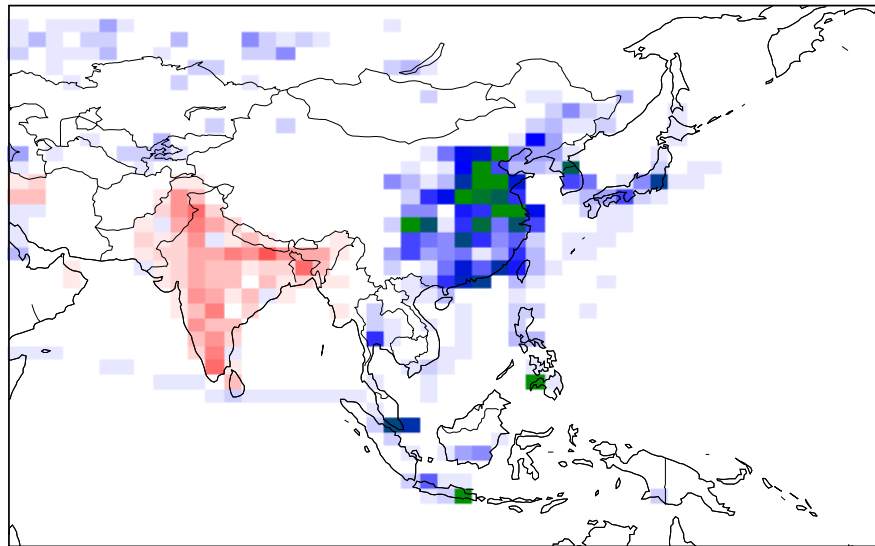

Variability across approaches depends upon response metric

# Importance of highly resolved source regions

Spatial heterogeneity in SO<sub>2</sub> emissions changes following  
- a single Representative Concentration Pathway for AR5

RCP 8.5: 2050 - 2000

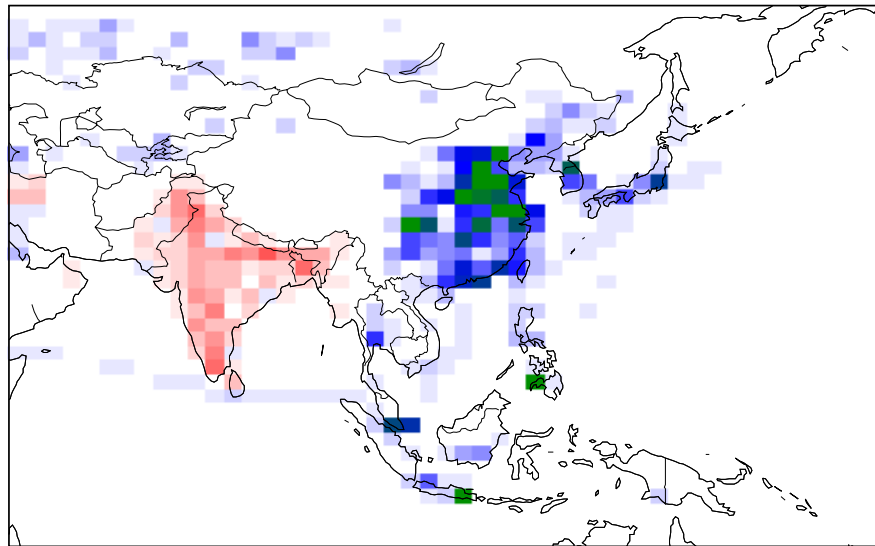

# Importance of high-resolution emissions-based RF

Spatial heterogeneity in SO<sub>2</sub> emissions changes following

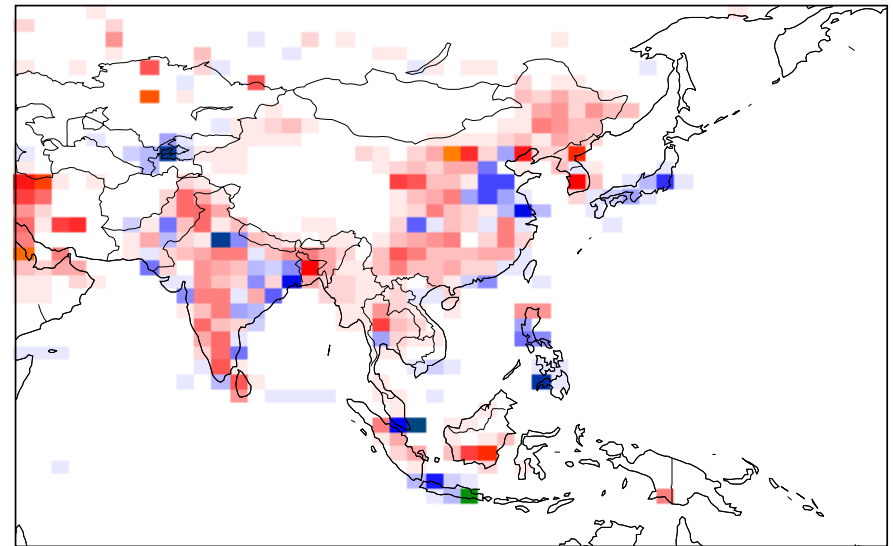

- a single Representative Concentration Pathway for AR5
- the difference between two Pathways for AR5

RCP 8.5: 2050 - 2000

-4.00e+08    -1.33e+08    1.33e+08    4.00e+08    [kg/yr]

RCP 8.5 2050 - RCP 4.5 2050

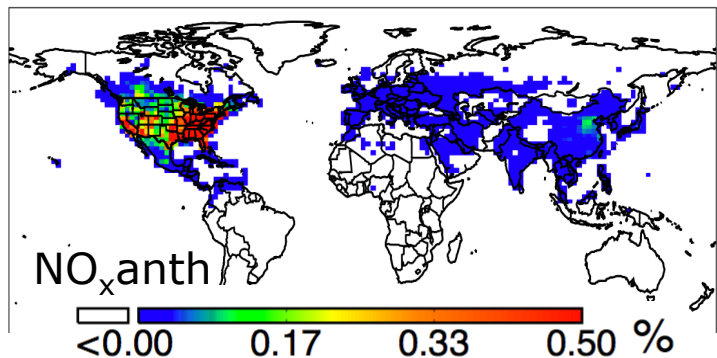

-2.00e+08    -6.67e+07    6.67e+07    2.00e+08    [kg/yr]

*Significant intra-regional variability*

# GEOS-Chem Adjoint, Cost Function = W126 in the US

Adjoint provides spatially-resolved sensitivities to emissions, which can be aggregated into % of W126 sensitivities by species, regions or sectors

by  
Region  
[%]

→

by species [%]

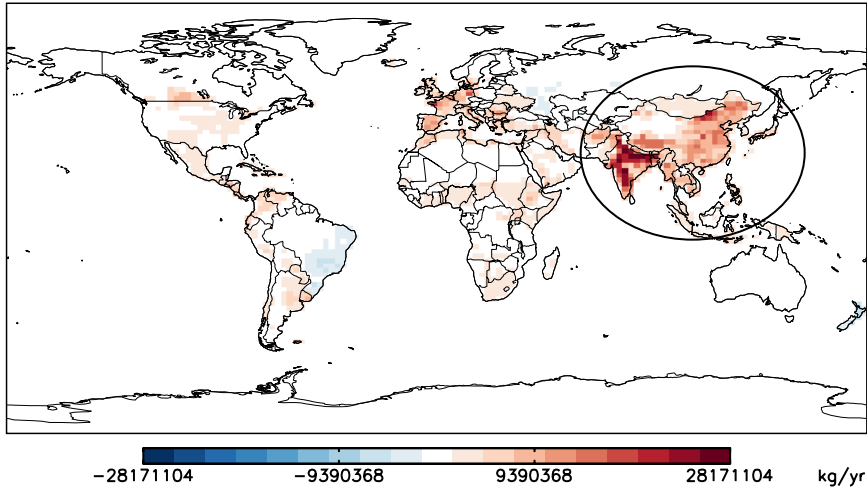

by sector [%]

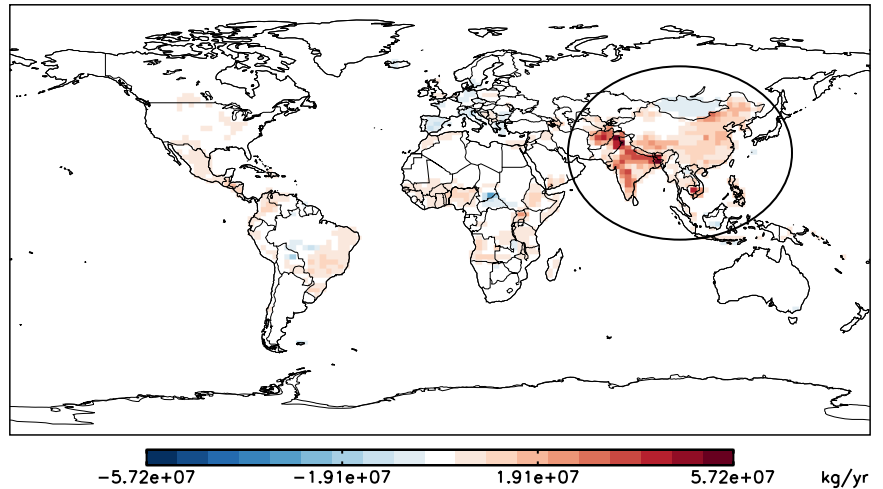

- No need to pre-specify source regions or sectors
- Must begin with specification of receptor
- Repeat calculations per receptor

# Cross-species impacts on aerosol DRF

NH<sub>3</sub> emissions: 2050 - 2000  
RCP 6.0

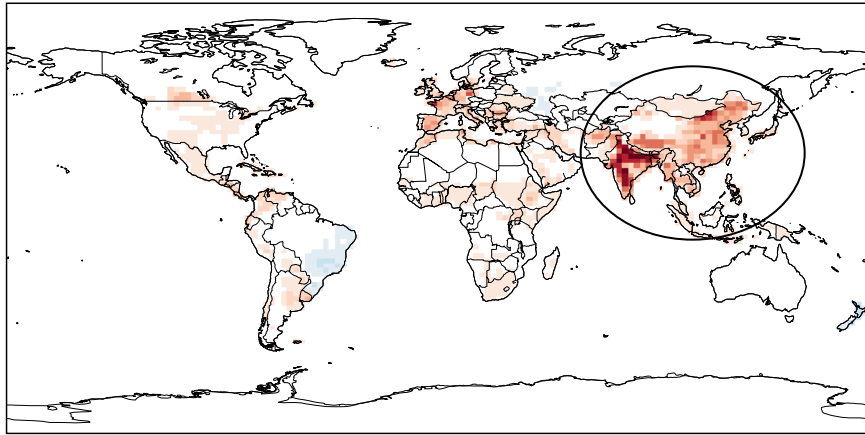

RCP 2.6

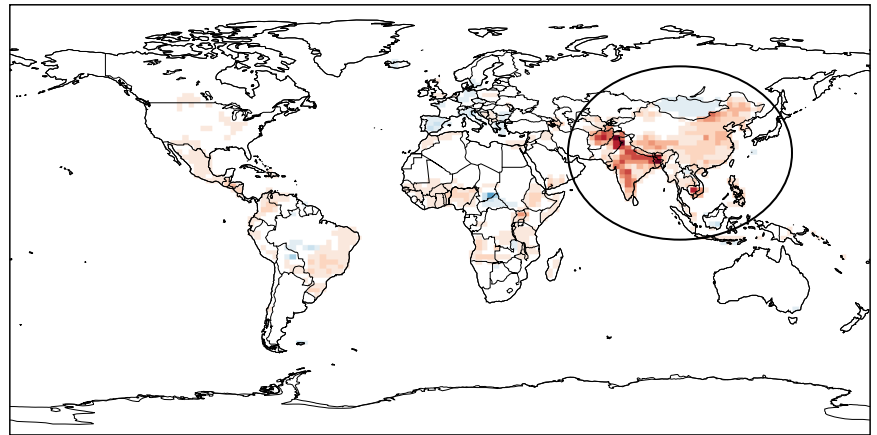

# Cross-species impacts on aerosol DRF

NH<sub>3</sub> emissions: 2050 - 2000  
RCP 6.0

-28171104 -9390368 9390368 28171104 kg/yr

RCP 2.6

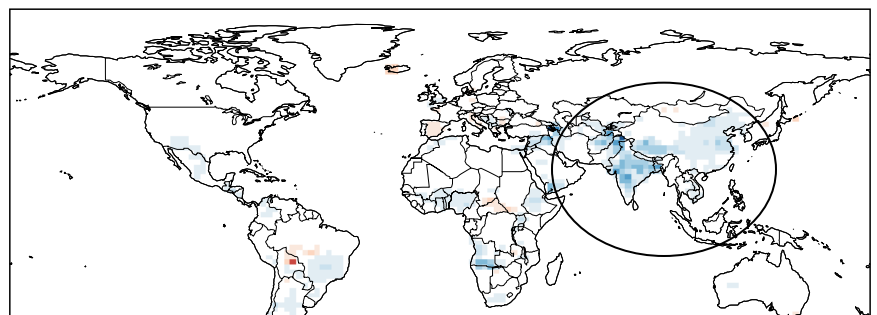

-5.72e+07 -1.91e+07 1.91e+07 5.72e+07 kg/yr

NH<sub>3</sub> DRF:  $(dRF/dE)_{6.0} * \Delta E$

-2.60e-03 -8.68e-04 8.68e-04 2.60e-03 W/m2

$(dRF/dE)_{2.6} * \Delta E$

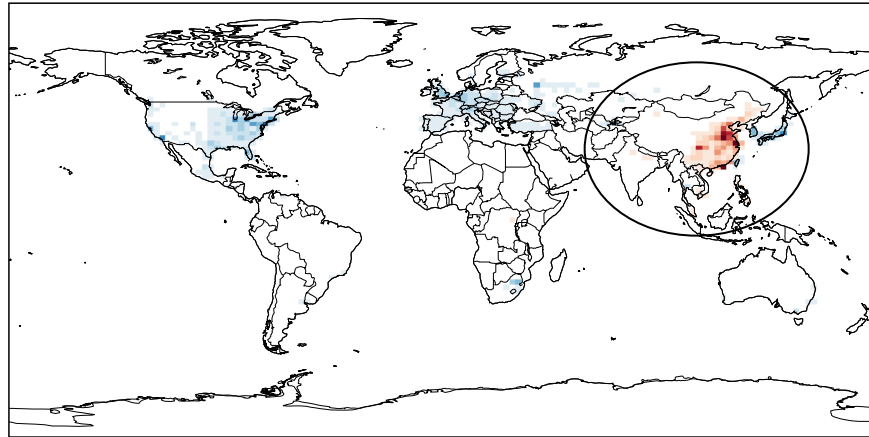

-1.60e-03 -5.34e-04 5.34e-04 1.60e-03 W/m2

Peak  $\Delta E$ 's in India and China have very different RFs...

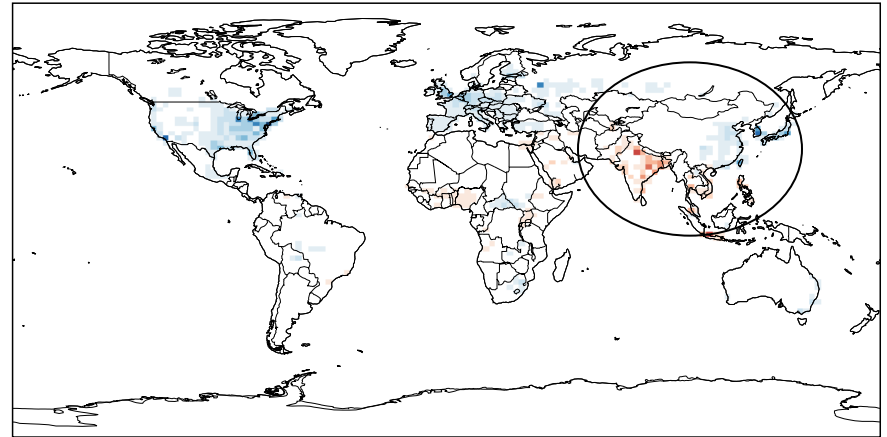

# Cross-species impacts on aerosol DRF

$\text{NO}_x$  emissions: 2050 - 2000  
RCP 6.0

-1.27e+08 -4.24e+07 4.24e+07 1.27e+08 kg/yr

RCP 2.6

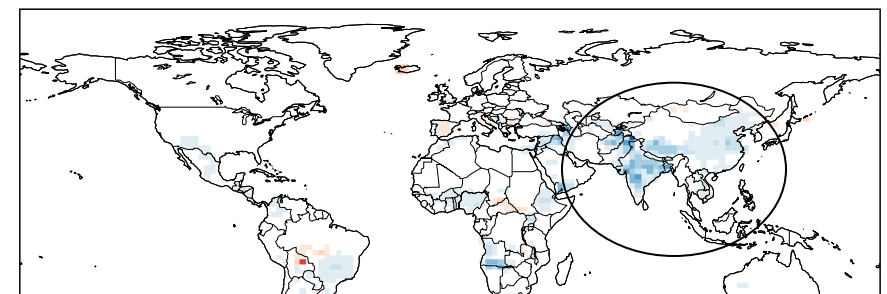

-1.35e+08 -4.51e+07 4.51e+07 1.35e+08 kg/yr

$\text{NH}_3$  DRF:  $(d\text{DRF}/dE)_{6.0} * \Delta E$

-2.60e-03 -8.68e-04 8.68e-04 2.60e-03 W/m2

$(d\text{DRF}/dE)_{2.6} * \Delta E$

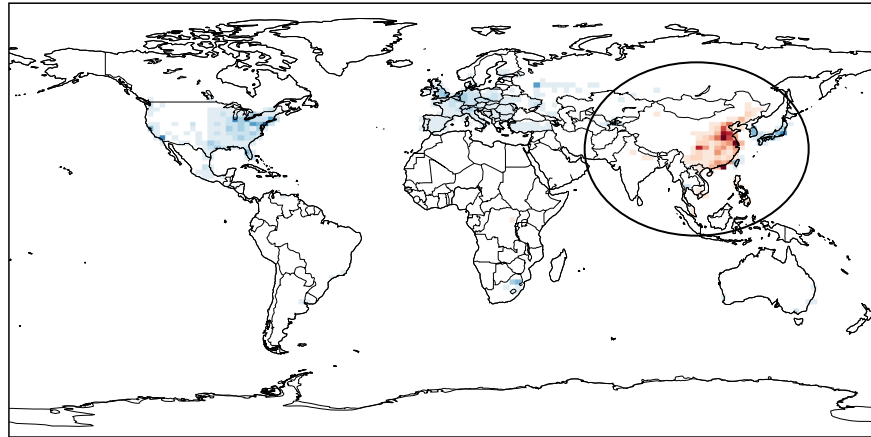

-1.60e-03 -5.34e-04 5.34e-04 1.60e-03 W/m2

Persistent influence of  $\text{NO}_x$  on  $\text{PM}_{2.5}$  in Asia (Kharol et al., 2013)

# Cross-species impacts on aerosol DRF

$\text{NO}_x$  emissions: 2050 - 2000  
RCP 6.0

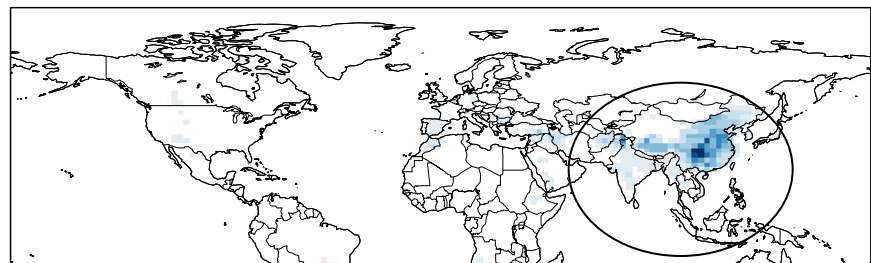

-1.27e+08    -4.24e+07    4.24e+07    1.27e+08    kg/yr

RCP 2.6

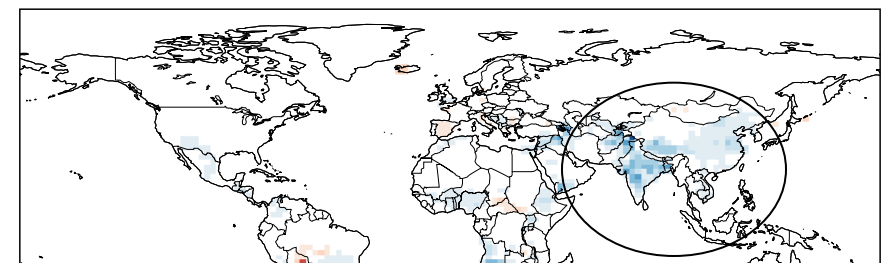

-1.35e+08    -4.51e+07    4.51e+07    1.35e+08    kg/yr

$\text{NH}_3$  DRF:  $(d\text{DRF}/dE)_{6.0} * \Delta E$

-2.60e-03    -8.68e-04    8.68e-04    2.60e-03    W/m2

$(d\text{DRF}/dE)_{2.6} * \Delta E$

-1.60e-03    -5.34e-04    5.34e-04    1.60e-03    W/m2

We should be evaluating our SR/SA relationships at multiple conditions

# HTAP 2.6: Comparison of SR and SA methods

Explore differences across models for a single SR approach

- need (new?) unifying normalized metrics
- incorporate observations to correct for bias?

Explore differences across SR approaches

- interpretation
- implementation (e.g., global <-> regional)

Additional considerations

- response-per emissions basis; need emissions harmonization?
- cross-sensitivities (space, species)
- validation experiments

Strategy

- target a few response metrics, response regions, future scenarios
- work from overlap with CCAC / NASA AQAST activities
- address issues listed above in detail for limited/targeted cases
